

Save time on tire pressure-checks with Hamaton's "DSV" Double-Seal Valve Cap

Hamaton | Innovation to Perfection

DSV
DOUBLE SEAL VALVE CAP

The "DSV" cap is designed to replace standard valve caps on truck and heavy-duty vehicle wheels, enabling tire pressure to be checked and inflation to be achieved directly through the valve cap. The valve seals in the same way as a high-pressure valve cap, yet offers the convenience and simplicity of an inflate-through extension, as there is no need for the valve caps to be removed at any time.

Benefits of the DSV cap:

- Significantly reduces pressure check times, minimising standstill periods and unnecessary costs
- Sealed valve cap protects the valve core from dirt and water, preventing corrosion and increasing its lifespan
- As the valve cap does not have to be removed, it cannot be lost or forgotten during air pressure checks – saving additional costs and improving safety

DSV: 2-706A
